Problem Statement

"Managing your brand still means leaving the Assistant chat"

Solution Overview

- Full brand CRUD conversationally
- Multi-step commands in one turn
- Auto-build a full brand kit from a guidelines PDF
- Brand context now flows into the generation pipeline

Architecture

Architecture

Brand Management Agent Architecture

Brand Library-Level Actions

- Create a brand library
- Rename a brand library
- Delete a brand library
- List all brand libraries
- Set brand guidelines (industry, audience, tone, overview)(new)

Brand Element-Level Actions

- Upload a logo or graphic
- List elements in a brand
- Rename or delete an element
- Duplicate an element within the same brand
- Copy or move an element to a different brand
- Set element role (primary/secondary) or font role (header/body)
- Add one or more fonts
- Extract a logo's colours and save as a palette
- Set usage instructions on a logo or graphic (**new**)
- Apply brand colours & fonts to the open design
- Add a logo/graphic to canvas

Brand Element-Level Actions

Multi-Step Chaining

Multi-Step Chaining Demo

PDF-to-Brand Auto Setup

User experience:

- Attach a brand guidelines PDF and the full brand kit is set up — logos, graphics, colours, fonts, and usage notes, all in one go

LOGO Comparison

Original

Generated

Challenges

Initially Understanding the existing codebase and Architecture

Frequent Doc model version mismatch errors

Model limitations in logo-accurate generation

Manually added logos/graphics had no captions, breaking fuzzy element matching

Future Scope

Embed the original logo directly onto the canvas at generation time

New metadata fields for brand intelligence

Expand brand context to webpage and presentation generation

Extend PDF-to-brand setup to support additional file formats (Markdown, Word) and handle more generalized document layouts

Opens doors for enterprise adoption — teams get consistent, on-brand AI-generated content managed through a single conversational workflow.

Thank You
